AI Match Score: 92.0%

AI VERDICT

ACCEPT

Som Pande demonstrates exceptional technical proficiency in generative AI and scalable backend development, evidenced by high-impact projects in RAG frameworks and cost-optimized automation. His 92% match score reflects deep alignment with required technologies like FastAPI and LLM orchestration. Despite having fewer years of professional experience than typically requested, his specific achievements in productionizing high-performance ML models make him a standout candidate.

TOP SKILL METRICS

Skill	Score (/5.0)
Python	5.0
Python Development	5.0
FastAPI	5.0
SQL	5.0
Pandas	5.0
Numpy	5.0
Data Science	4.5
Google Cloud Platform	4.5

ROLE AND PROJECT ALIGNMENT

Som Pande demonstrates a strong technical foundation in Python development and data science, specifically aligning with the requirement for building scalable backend services and AI-driven features. His work at KPMG involves migrating complex workflows from Alteryx to Python-based solutions, showcasing his ability to handle large-scale data ingestion and processing across Snowflake and SQL Server using Pandas and NumPy. His Modular AI RAG Framework project directly addresses the job's focus on productionizing machine learning models and optimizing system latency, where he achieved 92% response relevance and sub-1.2s response times using FastAPI and Qdrant. Furthermore, his experience designing backend APIs for supply-chain platforms with 90% test coverage and his work with cloud platforms like Azure and GCP meet the requirements for engineering best practices and infrastructure knowledge. While his professional tenure of approximately 1.5 years is shorter than the requested 4+ years for a mid-level role, his specialized experience in LLM orchestration, RAG architectures, and high-throughput data pipelines makes him a strong technical fit for a Data Science-oriented engineering team.

Relevant Projects:**• Alteryx To Python**

Developed a Python-based alternative for no-cost workflow automation using Pandas, NumPy, and PyODBC. He implemented a graph-driven approach to optimize OpenAI API usage by 40% and enabled seamless ingestion/export across Snowflake and SQL Server.

• Modular AI RAG Framework for Multi-Platform Assistants

Designed and deployed a stateless, plug-and-play RAG framework using FastAPI and Qdrant. This project highlights his ability to productionize ML models, achieve high relevance scores (92%), and maintain real-time performance under concurrent loads.

• Automated Email Response System

Built an intelligent mailing module using Gmail API, Google Pub/Sub, and FastAPI. This project demonstrates his proficiency in creating asynchronous backend services and integrating LLMs for dynamic, context-aware business logic.
